Eutrophication (from Greek eutrophos, "well-nourished") is the process by which an entire body of water, or parts of it, becomes progressively enriched with minerals and nutrients. Water bodies with very low nutrient levels are termed oligotrophic and those with moderate nutrient levels are termed mesotrophic. Advanced eutrophication may also be referred to as dystrophic and hypertrophic conditions.

Eutrophication - Wikipedia

Climate change is causing geographical redistribution of plant and animal species globally. These distributional shifts are leading to new ecosystems and ecological communities, changes that will affect human society. Pecl et al. review these current and future impacts and assess their implications for sustainable

Justify your answer by using the provided data. An organism that relies on infrared (IR) light would most likely be found in the Epipelagic zone of the ocean, at about 10-15 meters deep. This would be the case as the epipelagic zone is the first and foremost zone, and it is more shallow than the other zones.

Permaculture is an approach to land management and philosophy that adopts arrangements observed in flourishing natural ecosystems. It includes a set of design principles derived using whole systems thinking. It uses these principles in fields such as regenerative agriculture, rewilding, and community resilience. Permaculture originally came from "permanent agriculture", but was later adjusted to ...

Permaculture - Wikipedia

Teachers design an ill-structured problem based on desired curriculum outcomes, learner characteristics, and compelling, problematic situations from the real world. Teachers develop a sketch or template of teaching and learning events in anticipation of students' learning needs. Teachers investigate the range of resources essential to the problem and arrange for their availability.
