In metrology, measurement uncertainty is the expression of the statistical dispersion of the values attributed to a measured quantity. All measurements are subject to uncertainty and a measurement result is complete only when it is accompanied by a statement of the associated uncertainty, such as the standard deviation.

Measurement

uncertainty -

Wikipedia

information about the
doubt, or uncertainty,
of our estimate. 2.3 It
is also quite reasonable
to assume that we may
be more sure that our
estimate is within, say,
5 degrees of the “true”
room temperature than
we are that it is within
2 degrees. The larger
the uncertainty we
assign, the more
confident we are that it

encompasses the
"true" value.

The Expression of Uncertainty and Confidence in Measurement

Uncertainty of a measurement can be determined by repeating a measurement to arrive at an estimate of the standard deviation of the values. Then, any single value has an uncertainty equal to

Access Free Doubt Free

the standard deviation.

Uncertainty - Wikipedia

Definitions of uncertainty are not all helpful but all imply an element of doubt caused by a situation in which something is not known.

Measurement uncertainty can be quantified statistically where we have numerical data.
